

DAY-6

TASK:2 TESTING POSE DETECTION USING DIFFERENT PHOTOS AND VIDEOS

The goal of this task is to evaluate how accurately MediaPipe Pose Detection works on different types of images and videos. This helps understand the model's performance under varying conditions such as lighting, posture, camera angle, and movement.

Images which I tested:

FRONT POSE:

SIDE POSE:

SITTING POSE:

YOGA POSE:

LOW LIGHTING:

Observations from Testing Pose Detection on Multiple Images and Videos\

1. Front Pose Images

- Pose landmarks were detected accurately.
- Shoulders, elbows, hips, knees, and ankles were clearly visible.
- Full-body front view gave the most stable results.

2. Side Pose Images

- Some landmarks on the hidden side became less accurate.
- Shoulder and hip detection slightly shifted due to body rotation.
- Visibility scores reduced for partially hidden joints.

3. Sitting Pose Images

- Knee and hip landmarks were detected correctly in most cases.
- Folded body posture sometimes caused overlapping landmarks.
- Detection remained stable when the full body was visible.

4. Yoga Images

- Complex poses were still recognized successfully.
- Fast or unusual body angles occasionally caused landmark jitter.
- Flexible poses tested the robustness of the pose model.

5. Low Lighting Images

- Detection confidence reduced significantly in dim lighting.
- Some body landmarks disappeared intermittently.
- Good lighting greatly improved stability and accuracy.
