

DAY-6

TASK : 4 Creating a Basic Clothing Recommendation Dataset

The objective of this task was to create a basic dataset that can be used for a clothing recommendation system. The dataset helps AI models understand user preferences, clothing categories, sizes, colors, styles, and occasions in order to generate personalized outfit recommendations.

Dataset Fields I Included

1. User ID
2. Gender
3. Clothing type
4. Color
5. Size
6. Style

	A	B	C	D	E	F	G	H	I
1	User_ID	Gender	Clothing_Type	Color	Size	Style			
2	U001	Male	Hoodie	Black	M	Casual			
3	U002	Female	Dress	Red	S	Party			
4	U003	Male	Shirt	White	L	Formal			
5	U004	Female	Jeans	Blue	M	Casual			
6									
7									
8									
9									

I created this dataset in Microsoft Excel.

To access this excel dataset we need to install a library in our code. By using this *"pip install pandas openpyxl"*

Lets say I created this dataset and saved it as "reccom.xlsx" , then to access we will use this code.

```
1 import pandas as pd
2 |
3 df = pd.read_excel("reccom.xlsx")
4 print(df)
```

While creating the dataset, I understood that recommendation systems rely heavily on structured user and clothing data. Features such as clothing type, size, color, style, and user preferences help the AI model identify patterns and suggest relevant outfits. I also realized that cleaner and more detailed datasets improve recommendation accuracy and personalization.
